

Datalynx DMS Solutions

Data Migration to the Cloud

DMS CloudRamp simplifies and accelerates the transition of business data to the Cloud.

Utilising the Datalynx Platform Independent Data Management model (PIDM), CloudRamp can work with virtually any dataset, irrespective of the associated applications, file systems or hardware platforms.

CloudRamp harnesses the power of the DMS platform, providing access to extended migration capabilities such as data quality enhancement and standardisation, data transformation, master record creation, archiving and more; all as part of a flexible and comprehensive data migration process.

In addition to on-premise to Cloud migration, CloudRamp delivers equally effective within Cloud and between Cloud data migration capabilities.

CloudRamp can be configured for repeatable data migration between applications and is licensed via a cost-effective Cloud-based “as a service” subscription to system integrators delivering projects for their customers.
