

Datalynx DMS Solutions

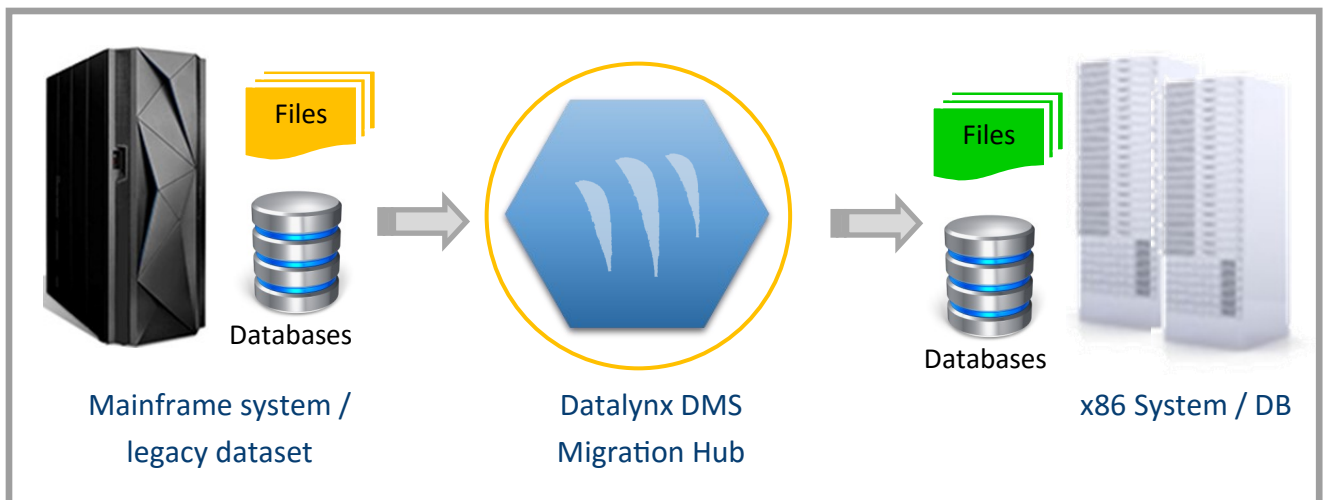

Migrating Data from Mainframe to x86

The Datalynx DMS is the ideal solution for migrating datasets on mainframe systems to the x86 platform.

By operating directly at the data level, the DMS can work on virtually any structured data without needing to navigate specific operating systems and applications.

Mainframe data migration options include:

- Rapid 1:1 data migration without changing the structure of the source data
- Advanced data migration incorporating optional processing such as dataset consolidation, transformation, data cleansing, MDM, data masking and more..

The DMS integrates with the following standard databases and file types and can also work with a broad range of less common datasets:
